Tutorial for LLM Verification Tool

Merging

Verification

Merging combines several already verified records, single or batch, into one new record with one new signature. This is useful when publishing results that were originally produced as separate runs.

Step 1: Open the Merge Receipts Tab

Open the Merge Receipts tab.

LLM Provenance Verification Tool

Merge Receipts	Verify
Merge Signed Records Upload several record + receipt pairs (single records and/or batches). Every pair is re-verified, then all of their LLM requests are combined into one record and signed once. If any pair fails to verify, the whole merge is refused.	
Record files Drag & Drop or Click to Upload	
Receipt files Drag & Drop or Click to Upload	
Merge & Sign	

Step 2: Upload Every Record and Receipt File

Drop in every record and receipt file you want to merge, all into the same box. It does not matter which is which, even files that share the same name (for example several batch_record.json files) are fine, each drop adds to the pile rather than replacing it.

Use Clear files if you want to start over.

record and signed once. If any pair fails to verify, the whole merge is refused.

Record + Receipt files

Drag & Drop or Click to Upload

Selected: batch_receipt.json, batch_record.json, batch_receipt.json, batch_record.json

Step 3: Merge and Sign

Click Merge & Sign. Every uploaded record and receipt pair is re-verified first. If any pair fails this check, the merge is refused and nothing is signed.

Merge & Sign

Step 4: Successful Merge

On success, the tool reports how many source files v combined into how many total LLM requests, plus the

new merged_id.

Merge & Sign

✓ Merged & signed

Combined 2 source(s) into 100 LLM request(s).

merged_id: 450003be

Step 5: Merge Refused

If any uploaded record or receipt fails verification, the tool refuses the merge entirely rather than signing a partially untrusted set.

Merge & Sign

Merge refused

MERGE REFUSED — 1_batch_record.json + 0_batch_receipt.json: signature does NOT verify (tampered, or signed by a different key) — merge refused

Step 6: Download the Merged Files

Click Download Merged Record and Download Merged Receipt to get the two files that together make up the new publishable bundle.

✓ Merged & signed

Combined 2 source(s) into 100 LLM request(s).

merged_id: 450003be

Definitions

Record

A record is the published file containing the prompt, output, model, timestamp, and hash for a single request, or the items array for a batch.

Receipt

The receipt contains the cryptographic signature generated over a record's hash (or, for a batch, over the combined batch hash).

Level 1 Verification

Level 1 checks only that the signature matches the record's hash. It does not require any of the original attached files.

Level 2 Verification

Level 2 additionally checks that uploaded files match the file hashes stored in the record, confirming the original attachments were not swapped.

Public Key

The public key is used to verify that a record's signature was produced by the witness's secret key.

Merged Record

A merged record is a new record combining the LLM requests from several already signed records or batches under one new signature.
